# Population health promotion 2.0: An eco-social approach to public health in the Anthropocene

Trevor Hancock, MB, BS, MHSc

## ABSTRACT

Humanity is both an animal species that evolved within and is dependent upon natural ecosystems and a social animal that exists within the social systems we have created. Our health is dependent upon both these systems – natural and social – functioning well, and indeed upon their interactions. Yet our approach to improving the health of the population over the past few decades has been largely, if not exclusively, focused on the social determinants of health. A recent Canadian Public Health Association (CPHA) Discussion Document and the technical report on which it is based seek to strike a more balanced approach. First, they document the dramatic and rapid global ecological changes that humans have created and argue that they are a significant threat to the health of the population in the 21<sup>st</sup> century. Second, they identify the underlying social, cultural and economic forces that are driving these changes. Third, they argue that we need to take an eco-social approach in population health promotion, recognizing the interactions between the ecological and social determinants of health. Such an approach could be considered to be ‘Population health promotion 2.0’, and it has profound implications for the practice of public health.

**KEY WORDS:** Health promotion; ecosystem; ecological and environmental phenomena; social determinants of health

## UNIVERSAL HEALTH COVERAGE DATA PORTAL

Supporting the Universal Health Coverage Coalition

At least half of the world's 7.3 billion people still lack full coverage with essential health services

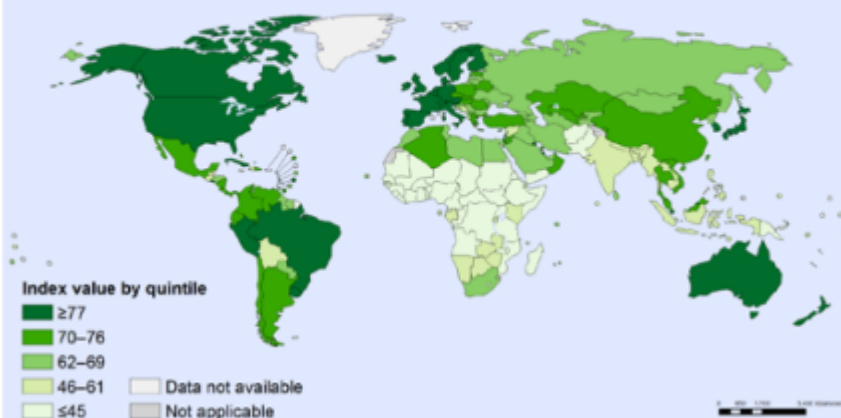

Coverage of essential health services has increased since 2000, but inequalities persist

Over 800 million people (almost 12 percent of the world's population) spent at least 10 percent of their household budgets in 2010 on out-of-pocket health expenditures

About 100 million people in 2010 fell into extreme poverty (living on \$ 1.90 or less a day) because of out-of-pocket health expenditures

### SERVICE COVERAGE

# WHO GUIDELINE RECOMMENDATIONS ON DIGITAL INTERVENTIONS FOR HEALTH SYSTEM STRENGTHENING

## Foreword

Human health has only ever improved because of advances in technology. From the development of modern sanitation to the advent of penicillin, anesthesia, vaccines and magnetic resonance imaging, science, research and technology have always been key drivers of better health.

It's no different today. Advances in technology are continuing to push back the boundaries of disease. Digital technologies enable us to test for diabetes, HIV and malaria on the spot, instead of sending samples off to a laboratory. 3-D printing is revolutionizing the manufacture of medical devices, orthotics and prosthetics. Telemedicine, remote care and mobile health are helping us transform health by delivering care in people's homes and strengthening care in health facilities. Artificial intelligence is being used to give paraplegic patients improved mobility, to manage road traffic and to develop new medicines. Machine learning is helping us to predict outbreaks and optimize health services.

Propelled by the global ubiquity of mobile phones, digital technologies have also changed the way we manage our own health. Today we have more health information – and misinformation – at our fingertips than any generation in history. Before we even sit down in a doctor's office, most of us have Googled our symptoms and diagnosed ourselves – perhaps inaccurately. Similarly, digital technologies are being used to improve the training and performance of health workers, and to address a diversity of persistent weaknesses in health systems.

Harnessing the power of digital technologies is essential for achieving the Sustainable Development Goals, including universal health coverage and the other "triple billion" targets in WHO's 13th General Programme of Work. Such technologies are no longer a luxury; they are a necessity.

A key challenge is to ensure that all people enjoy the benefits of digital technologies for everyone. We must make sure that innovation and technology helps to reduce the inequities in our world, instead of becoming another reason people are left behind. Countries must be guided by evidence to establish sustainable harmonized digital systems, not seduced by every new gadget.

That's what this guideline is all about.

At the Seventy-First World Health Assembly, WHO's Member States asked us to develop a global strategy on digital health. This first WHO guideline establishes recommendations on digital interventions for health system strengthening and synthesizes the evidence for the most important and effective digital technologies.

The nature of digital technologies is that they are evolving rapidly; so will this guideline. As new technologies emerge, new evidence will be used to refine and expand on these recommendations. WHO is significantly enhancing its work in digital health to ensure we provide our Member States with the most up-to-date evidence and advice to enable countries to make the smartest investments and achieve the biggest gains in health. Ultimately, digital technologies are not ends in themselves; they are vital tools to promote health, keep the world safe, and serve the vulnerable.

Dr Tedros Adhanom Ghebreyesus  
Director-General, World Health Organization

# Local action to improve health literacy and reduce health inequalities

Improving health literacy to reduce health inequalities

# HPH Level and Performance

# Five HL-related Scores on Taiwan HH standards

**3.2.4** The hospital has a health-literacy promoting plan that aims to help patients obtain, comprehend, and apply information and services to improve their health and the provision of care

## Description

(1 of the following items completed for “Incomplete”; 2-4 for “Partially completed”; 5 for “Completed”)

1. Health literacy training is provided to staff.
2. Information to help others navigate the medical environment is provided.
3. A health information communication framework that conforms with health literacy principles is established, including various channels and information (e.g., oral, graphics, media, and digital information).
4. Activities or measures to improve the health literacy of patients and their family members are provided (e.g., group health education seminars).
5. Activities or measures to improve community health literacy is provided.

# Health Literacy in Healthy Hospital

## ■ Health Literacy

- Promotion of HL by hospitals allow patients to easily understand and obtain information and services, which promotes better healthcare and health gains.

- Education training on HL for staff members
- Information about the medical environment
- Communication that adheres to HL, such as information through various formats and channels (oral, graphic, audio-visual, digital), and involves users
- Activities that enhance the HL of patients and their family members (e.g. group education and seminar)
- Community activities that enhance HL

## ■ SDM

- Shared decision making fosters better communication between patients, family members and medical personnel, empowering patients the power to making care-related design

- SDM policies and guidelines by hospital
- Performance monitoring, documentation and discussion
- Involving patients and family members in SDM process

# Healthcare Providers

## Providing Health Literacy Services

- Development of health literacy education training courses
  - Module on health literacy concepts
  - Module on health literacy verbal communication
  - Module on health literacy written communication
  - Module on community health literacy
- Health literacy education training
  - health/medical professionals
  - community health professionals
  - “flipped classroom” strategies
  - e-learning

Review

## Digital Health Professions Education on Diabetes Management: Systematic Review by the Digital Health Education Collaboration

**Background:** There is a shortage of health care professionals competent in diabetes management worldwide. Digital education is increasingly used in educating health professionals on diabetes. Digital diabetes self-management education for patients has been shown to improve patients' knowledge and outcomes. However, the effectiveness of digital education on diabetes management for health care professionals is still unknown.

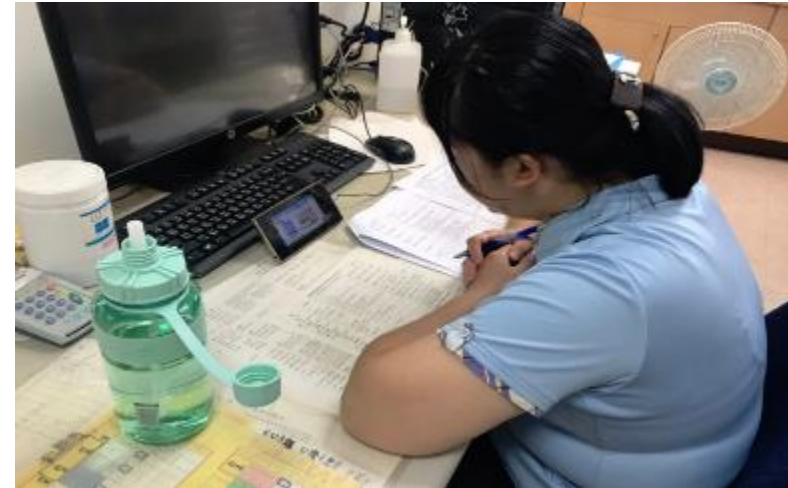

**Objective:** The objective of this study was to assess the effectiveness and economic impact of digital education in improving health care professionals' knowledge, skills, attitudes, satisfaction, and competencies. We also assessed its impact on patient outcomes and health care professionals' behavior.

**Methods:** We included randomized controlled trials evaluating the impact of digitalized diabetes management education for health care professionals pre- and postregistration. Publications from 1990 to 2017 were searched in MEDLINE, EMBASE, Cochrane Library, PsycINFO, CINAHL, ERIC, and Web of Science. Screening, data extraction and risk of bias assessment were conducted independently by 2 authors.

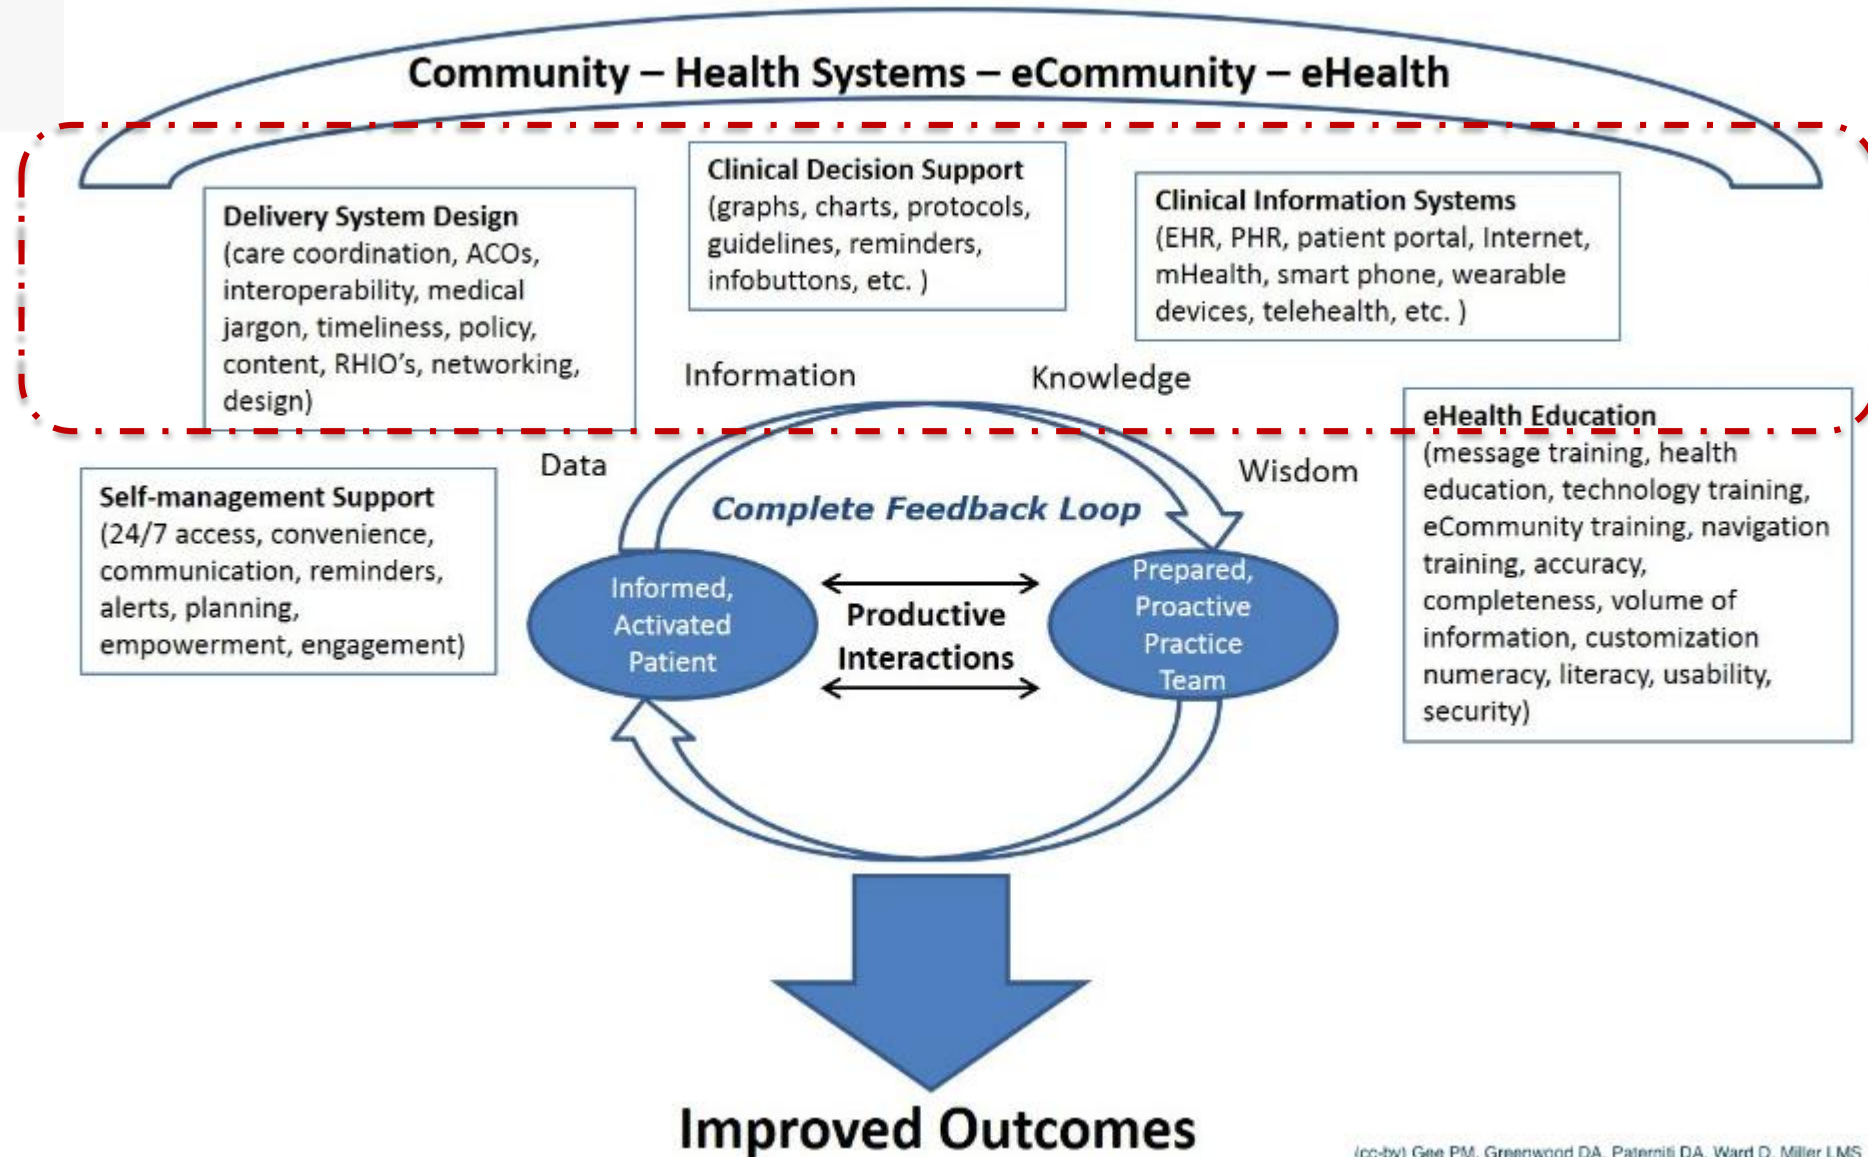

**Results:** A total of 12 studies met the inclusion criteria. Studies were heterogeneous in terms of digital education modality, comparators, outcome measures, and intervention duration. Most studies comparing digital or blended education to traditional education reported significantly higher knowledge and skills scores in the intervention group. There was little or no between-group difference in patient outcomes or economic impact. Most studies were judged at a high or unclear risk of bias.

**Conclusions:** Digital education seems to be more effective than traditional education in improving diabetes management-related knowledge and skills. The paucity and low quality of the available evidence call for urgent and well-designed studies focusing on important outcomes such as health care professionals' behavior, patient outcomes, and cost-effectiveness as well as its impact in diverse settings, including developing countries.

# Global Conference on Primary Health Care

From Alma-Ata towards universal health coverage  
and the Sustainable Development Goals

**Astana, Kazakhstan, 25 and 26 October 2018**

We, Heads of State and Government, ministers and representatives of States and Governments<sup>1</sup>, participating in the Global Conference on Primary Health Care: From Alma-Ata towards universal health coverage and the Sustainable Development Goals, meeting in Astana on 25 and 26 October 2018, reaffirming the commitments expressed in the ambitious and visionary Declaration of Alma-Ata of 1978 and the 2030 Agenda for Sustainable Development, in pursuit of Health for All, hereby make the following Declaration.

# Revisiting Alma-Ata: what is the role of primary health care in achieving the Sustainable Development Goals?

*Thomas Hone, James Macinko, Christopher Millett*

The Sustainable Development Goals (SDGs) are now steering the global health and development agendas. Notably, the SDGs contain no mention of primary health care, reflecting the disappointing implementation of the Alma-Ata declaration of 1978 over the past four decades. The draft **Astana declaration (Alma-Ata 2.0), released in June, 2018,** restates the key principles of primary health care and renews these as driving forces for achieving the SDGs, **emphasising universal health coverage. We use accumulating evidence to show that countries that reorient their health systems towards primary care are better placed to achieve the SDGs than those with hospital-focused systems** or low investment in health. We then argue that an even bolder approach, which fully embraces the Alma-Ata vision of primary health care, could deliver substantially greater SDG progress, by addressing the wider determinants of health, promoting equity and social justice throughout society, empowering communities, and being a catalyst for advancing and amplifying universal health coverage and synergies among SDGs.

*Lancet 2018; 392: 1461–72*

Public Health Policy Evaluation Unit, School of Public Health, Imperial College London, London, UK (T Hone PhD, Prof C Millett PhD); Department of Community Health Sciences and Department of Health Policy and Management, UCLA Fielding School of Public Health, Los Angeles, CA, USA (Prof J Macinko PhD); and Center for Epidemiological

[www.thelancet.com](http://www.thelancet.com) Vol 392 October 20, 2018

# The Astana Declaration: time to focus on primary health care

It has been 40 years since the Alma-Ata Declaration enshrined health as a fundamental human right and argued that primary health care was the key to delivering health for all. Although ambitious, the Declaration was just. And yet it failed. Huge health inequities persist and hundreds of millions of people lack access to even the most basic primary health-care services. The Astana Declaration, which in late October reaffirmed a global commitment to primary health care, sets out the only sensible way to ensure health for all. Prioritising primary health care as an issue fundamental to infectious diseases is long overdue.

The Declaration of Astana was issued at the Global Conference on Primary Health Care, organised by WHO, UNICEF, and the Government of Kazakhstan, in Astana, Kazakhstan, Oct 25–26. In it, governments, non-governmental organisations, health practitioners, and researchers recognise that all people are entitled to the highest possible standard of health and wellbeing. The Declaration pledges the development of primary health care systems that are “high quality, safe, comprehensive, integrated, accessible, available, and affordable for everyone and everywhere”.

Disease-specific approaches have delivered some huge successes. Gains in HIV control owe much to dedicated institutions such as UNAIDS, PEPFAR, and the Global Fund to Fight AIDS, Tuberculosis and Malaria. Likewise, the near eradication of polio is largely down to focused efforts of governments, backed by institutions such as the Gates Foundation. These organisations will have to square their approaches with the spirit of the Astana Declaration.

Access to good primary health care will aid the proper diagnosis and treatment of common infections, reducing the risk of antimicrobial resistance. Better health promotion and disease prevention, through effective public health measures, vaccination, and education, is sustainable and effective, far more so than testing and treatment. A well integrated and equitable primary health-care system is needed to treat patients coinfectd with tuberculosis and HIV.

Strong primary health care also fortifies countries against infectious outbreaks. In this issue, Catherine Bozio and colleagues report an outbreak of *Neisseria meningitis* C infection in Liberia first identified by community health-care workers who then initiated an international response through infrastructure installed after the west African

**ON PRIMARY  
HEALTH CARE**

**Digital technologies:**  
shaping the future of  
primary health care

## Shaping the future of primary health care

Improving the accessibility, affordability and quality of health care is at the heart of primary health care. The three pillars of primary health care are primary care and essential public health functions as the core of integrated health services, multi-sectoral policy and action, and empowered people and communities (World Health Organization, *A vision for primary health care in the 21st century*, 2018). Numerous examples of digital technologies, outlined below, attest to their versatility, utility and ubiquity in supporting these pillars in the context of health development (5).

### High-quality primary care and essential public health functions

Digital technologies of all kinds have become essential resources in primary care and their uptake is growing (6), with the past decade seeing rapid integration of technology in a range of areas that support primary care and essential public health functions. In this context, common uses of digital technologies include searching medical knowledge resources, facilitating clinical support, monitoring quality of care, and mapping and monitoring the spread of infectious diseases, as well as tracking supplies of drugs and vaccines.

Integrating clinical support tools and referral systems into primary health care can help coordinate care and ensure its continuity across primary, secondary, acute and aged care services. Electronic health records capture information about an individual's health, medical conditions, medications and key events, which can be shared for referrals and timely clinical decision-making. Digital technologies can help improve the patient journey. They can prevent duplication of care processes and enhance communication between providers as well as avoid unplanned hospitalizations and visits for urgent care. Ensuring that the general public has access to timely, expert advice by telephone in health emergencies can save lives.

## Abstract

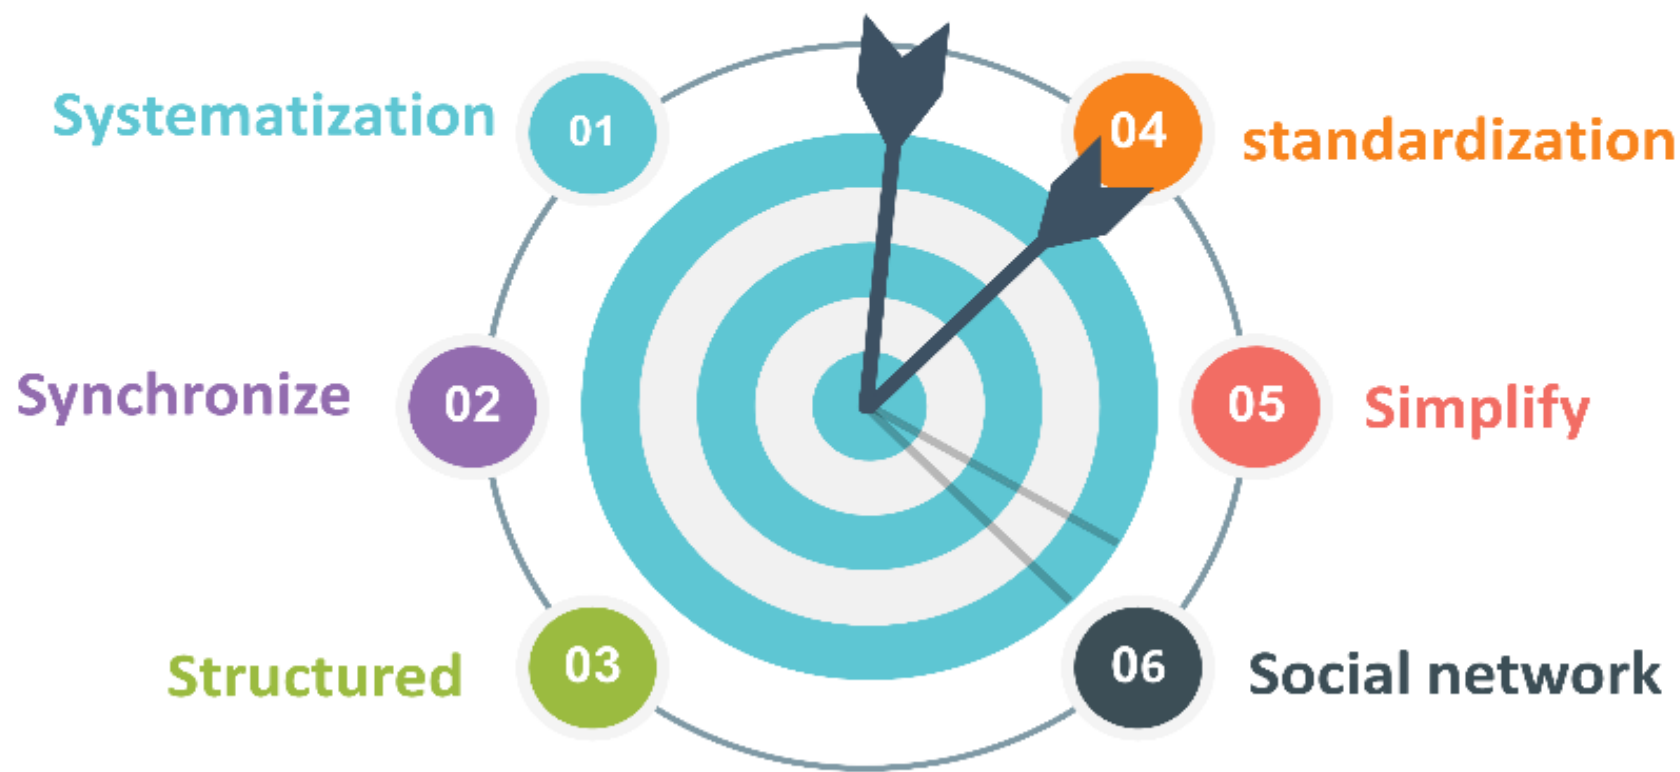

**Purpose of Review** Diabetes care is undergoing a remarkable transformation by the advancements in information and communications technology (ICT). The aim of this review is to provide a general overview of various ICT-based interventions for diabetes care, challenges of their adoption, and consider future directions.

**Recent Findings** A number of systematic reviews have examined studies on various aspects of telemedicine and eHealth for diabetes care, but they are generally focused on one specific type of technology application for diabetes care.

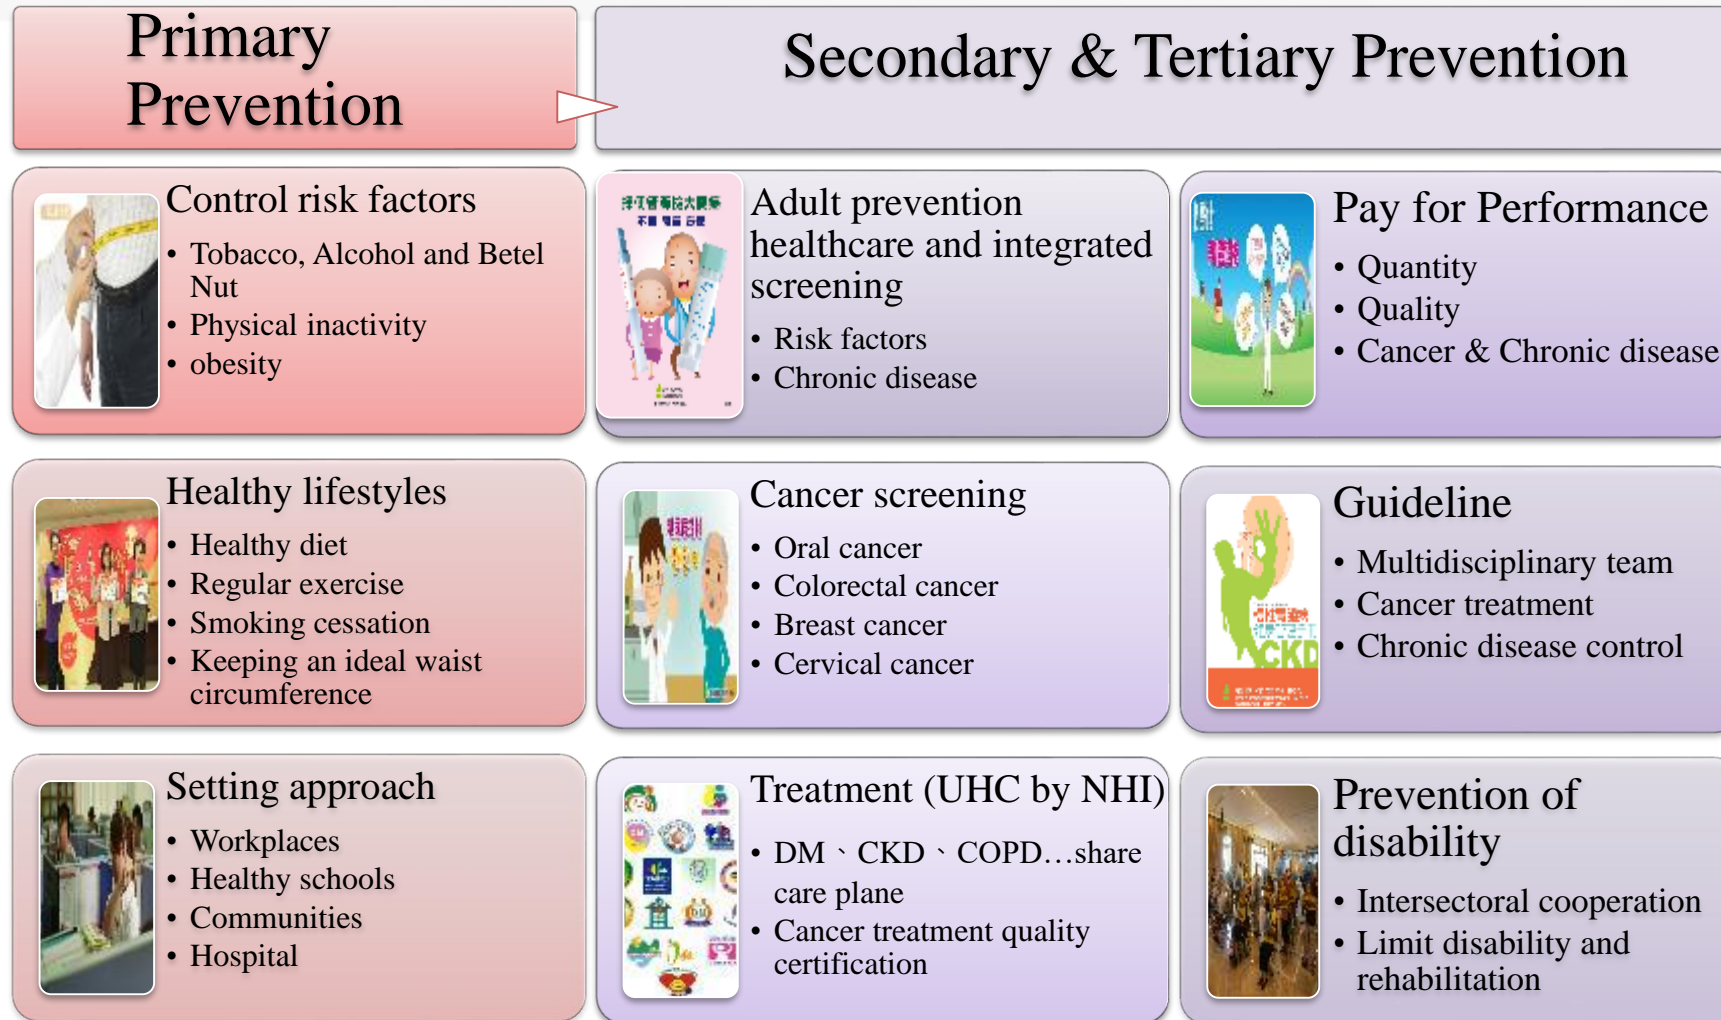

**Summary** A wide range of solutions from manual or automated telephone calls, short message services, websites, mobile health apps, remote monitoring devices, and sophisticated artificial intelligence systems has been studied in different settings and scopes with mixed results. However, despite the promising results of research studies, such innovative solutions are not widely adopted by health systems worldwide. Lack of supportive policy and legislation, unsustainable reimbursement, inefficient business models, and concerns regarding the security and privacy of health data are among the most problematic barriers.

## 救救肝苦人

比肝之苦 還要苦一些的是肝友  
需要更多支持與專業醫療資源

肝纖維化指數是肝臟中脂肪堆積的指標。肝臟不具備痛覺神經，所以肝臟在慢性B型肝炎患者中通常沒有痛覺。當慢性B型肝炎患者使用此工具時，

### 肝病的危險群

肝病患者有肝病的人，稱為「肝病的危險族群」，包括：

1. 肝炎患者。
2. 膽結石患者。
3. 3型肝炎患者及C型肝炎患者。
4. 家族中有人罹患肝病患者。

### 肝癌是怎麼發生的？

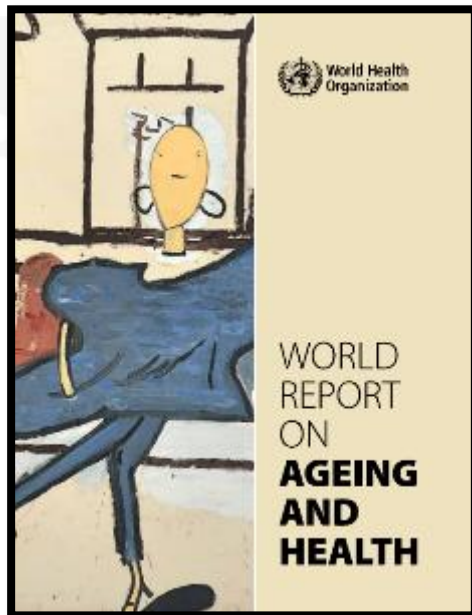

肝臟是血液濾清器，肝臟的血液由十多種肝，由十多種肝臟細胞相互作用，共同完成血液濾清。血液濾清後，血液會流入肝臟。

大多數肝癌是由肝臟細胞發生癌變而形成的。肝臟細胞癌變後，會導致肝臟細胞死亡，而肝臟細胞死亡後，肝臟細胞會再生，而再生後，肝臟細胞會癌變。

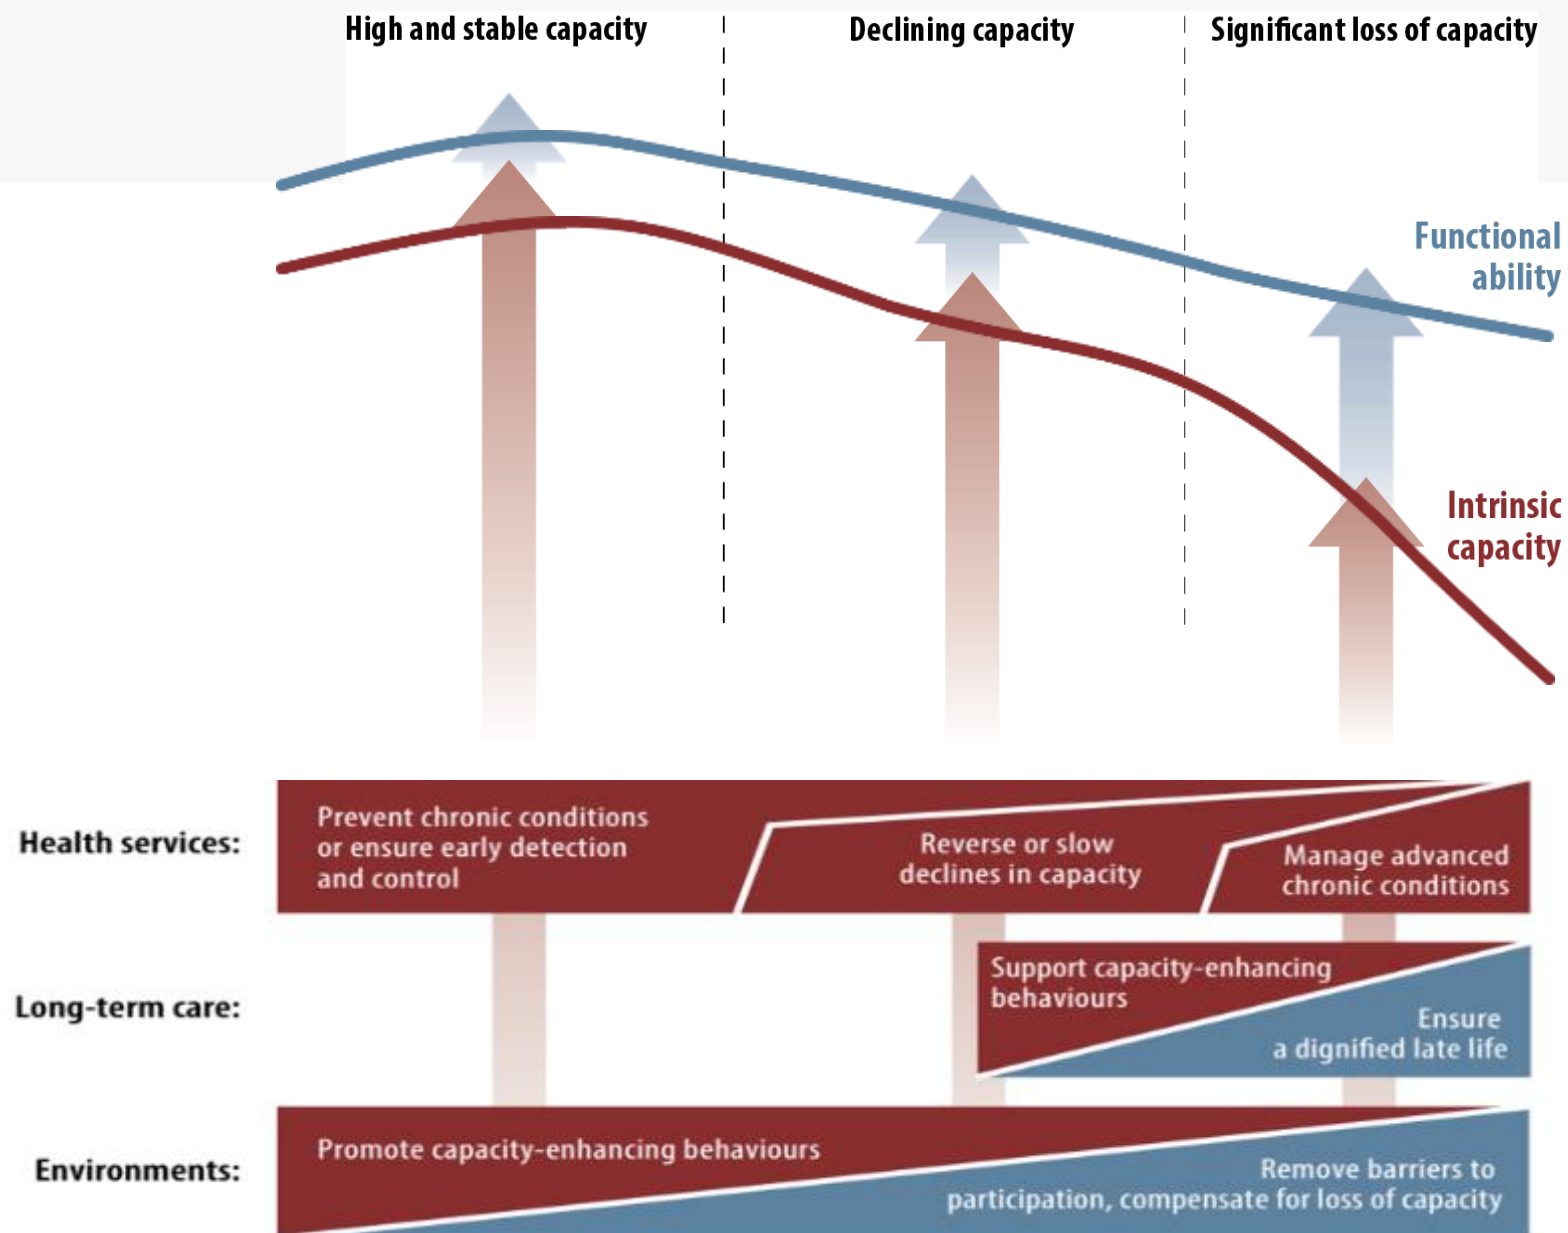

年齡	肝癌發生率
50~59	1%~10%
60~69	10%~20%
70~79	30%~50%
80~89	50%~60%

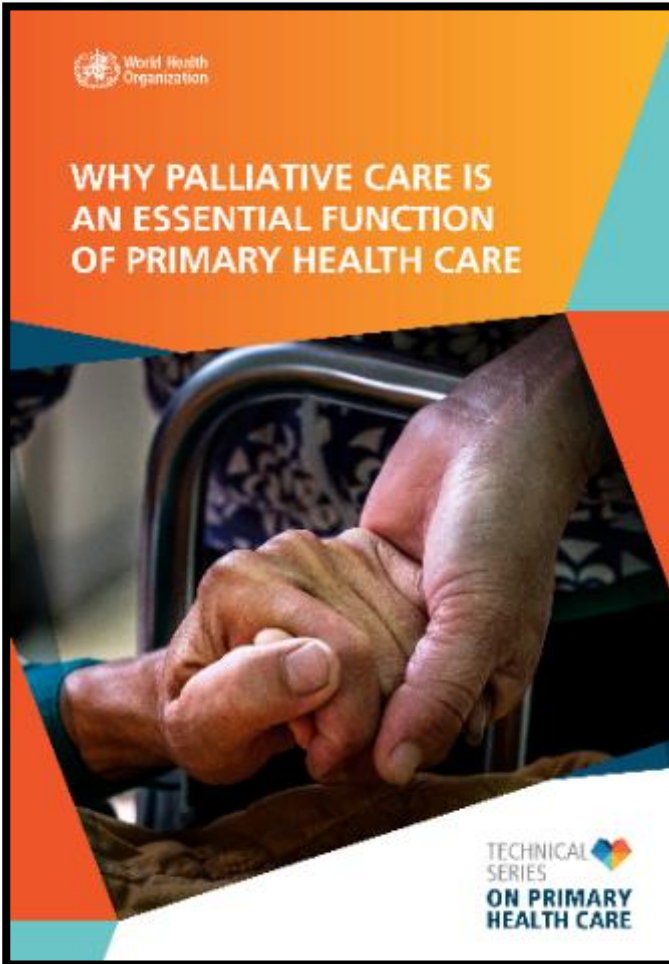

註 1

1. 合併感染HIV、乙型肝炎、D型肝炎、肝硬化、ALT突然上升大於正常值的患者、肝纖維化患者不適用。
2. 慢性B型肝炎或酒精性肝病，風險可能提高。
3. 肝硬化、膽結石、肝硬化或肝硬化後的患者，風險可能提高。
4. 慢性B型肝炎患者與酒精性肝病，都會導致肝臟功能降低。
5. 脂肪肝患者進入健康師的醫療課程上陣之經驗（暫）結果證實。
6. 如果「重新計算」功能可自行修改管理資料、幫您管理健康之資料、知識庫「重新輸入個人資料」按鈕。

## Abstract

In the future artificial intelligence (AI) will have the potential to improve outcomes diabetes care. With the creation of new sensors for physiological monitoring sensors and the introduction of smart insulin pens, novel data relationships based on personal phenotypic and genotypic information will lead to selections of tailored, effective therapies that will transform health care. However, decision-making processes based exclusively on quantitative metrics that ignore qualitative factors could create a quantitative fallacy. **Difficult to quantify inputs into AI-based therapeutic decision-making processes include empathy, compassion, experience, and unconscious bias. Failure to consider these “softer” variables could lead to important errors.** In other words, that which is not quantified about human health and behavior is still part of the calculus for determining therapeutic interventions.
